

# Community Immunity & Comparing Vaccines

## Moderna & Pfizer's COVID-19 vaccine study participants by race & ethnicity, age groups, and binary gender

### Will I be injected with the COVID-19 virus? No.

The vaccine cannot cause infection or make someone sick with COVID-19. While some vaccines are made from weakened or killed viruses, these vaccines do not contain either.

### Will I have side effects from these vaccines? Possibly.

The most frequently reported side effects are mild headache, fatigue, fever, muscle aches, joint pain, injection site skin reddening, and injection site pain. These side effects are similar to the Flu vaccine and should go away within 2-5 days. If they do not, or are worse than expected, call a doctor or clinic right away.

### Can I have either of these vaccines if I am under 18 years? No.

These vaccines are still being studied for safety in young people under 18 years.

### Do I need to receive the same vaccine for the 2<sup>nd</sup> injection? Yes.

These vaccines consist of 2 injections about a month apart. The vaccine you receive for the 1<sup>st</sup> injection, must be followed with the **SAME** vaccine for the 2<sup>nd</sup> injection. The safety and effectiveness of switching vaccine types has not been studied.

### Are these vaccines expensive? No.

These vaccines are completely **FREE** even if you do not have health insurance. Ask your doctor, clinic, or pharmacist about it.

### Do I still follow the safety guidelines after I am vaccinated? Yes.

Vaccination does not guarantee that you will not pass the COVID-19 virus to your family and friends. Continue to wear a face covering, wash your hand regularly and social distance.

Information current as of January 27, 2021.
